About Finovation

At **Finovation**, we are a team of dedicated professionals, who are passionate about technology. We hold the belief that leveraging technology empowers us to create more inclusive **Healthcare** landscapes for all.

Our organization dedicates its efforts solely to initiatives within the **Healthcare** sector. This specialized focus allows us to channel our expertise, resources, and capabilities into this domain, ensuring a high level of proficiency and effectiveness in our project execution.

Vision

Empowering industries through cutting-edge technology, Finovation pioneers' transformative solutions in **Healthcare**. Our vision is to revolutionize this sector, driving inclusive innovation and reshaping the future of digital ecosystems.

Mission

Our mission is to bridge traditional finance with the emerging digital economy. We're committed to inclusivity, empowering individuals and businesses by providing the tools and knowledge to seize the vast financial opportunities in the interconnected world.

HealthCare Portfolio

Project 1 : Medication Adherence tracker

Problem Statement: Medication adherence occurs when a patient takes their medications according to the prescribed dosage, time, frequency, and direction. In the United States, while about 4 billion prescriptions are written annually, roughly one in five new prescriptions are never filled. For those filled, only about half are taken correctly.

What We Have Done:

- Developed a medication adherence solution that collects and compares data from prescriber to POS data of pharmacies to identify patients that may not have picked-up their prescriptions within 48 hours of sending e-prescription.
- Tele callers/pharmacists call patients to identify and resolve adherence barriers
- Collaborative solution with input and assistance from team of resources including prescriber, case manager, social worker, pharmacies and home delivery teams.
- Realized outcomes includes patient adherence, health outcomes, total cost reduction and better patient experience.

Project 2: Enterprise Clinical Data Pipeline

Problem Statement: Acquire and standardize the clinical data like Lab results, continuity care documents from laboratories, clinics, HIEs etc. The data is in various formats as each hospital is different system. Standardize the data and convert to FHIR standard and make it available for various needs like identifying gaps in care, HEDIS reporting for USA government etc.

What We Have Done:

- Developed a framework for acquiring and parsing a variety of medical data formats including Continuity of Care Document, Laboratory Records, hospital admission and discharge data, X12 and delimited files.
- Built a common framework as a service to convert HL7 V2, V3 and JSON data into FHIR standards by providing liquid map templates as configuration.
- Store the data in enterprise data warehouse sitting on Snowflake in Azure.
- Designed and implemented APIs that operate on top of Fast Healthcare Interoperability Resources (FHIR) data. These APIs were developed to serve downstream consumers, such as healthcare applications and systems, providing them with efficient and standardized access to FHIR data..

Project 3: Data Lake (Data Ingestion and Provisioning Framework)

Problem Statement: Gather data from various hospitals/laboratories and render it accessible to multiple applications in a user-friendly format. This encompasses real-time acquisition of hospital admission, transfers, and discharge data. Additionally, it involves collecting clinical metrics with regulatory reporting being one of the pivotal use cases.

What We Have Done:

- Crafted a versatile framework that efficiently consolidates data from diverse origins, like the CDC and various streaming platforms, storing it into a central data lake. This process includes meticulous data refinement, quality assessments, and standardized formatting, ensuring seamless integration with downstream applications.
- Implemented robust security measures at the column level to bolster data governance, enabling controlled access and fortifying data integrity.
- The Data lake incorporated optimizing metadata, security, cataloguing, and integrations to ensure seamless and secure access, fostering efficient data-driven decisions within the organization.
